Use this model

Instructions to use HuggingFaceTB/SmolLM3-3B with libraries, inference providers, notebooks, and local apps. Follow these links to get started.

Libraries

Transformers

How to use HuggingFaceTB/SmolLM3-3B with Transformers:

```
# Use a pipeline as a high-level helper
```

```
from transformers import pipeline
```

```
pipe = pipeline("text-generation", model="HuggingFaceTB/SmolLM3-3B")
```

```
messages = [
```

```
    {"role": "user", "content": "Who are you?"},
```

```
]
```

```
pipe(messages)
```

```
# Load model directly
```

```
from transformers import AutoTokenizer, AutoModelForCausalLM
```

```
tokenizer = AutoTokenizer.from_pretrained("HuggingFaceTB/SmolLM3-3B")
```

```
model = AutoModelForCausalLM.from_pretrained("HuggingFaceTB/SmolLM3-3B")
```

```
messages = [
```

```
    {"role": "user", "content": "Who are you?"},
```

```
]
```

```
inputs = tokenizer.apply_chat_template(
```

```
    messages,
```

```
    add_generation_prompt=True,
```

```
    tokenize=True,
```

```
    return_dict=True,
```

```
    return_tensors="pt",
```

```
).to(model.device)
```

```
outputs = model.generate(**inputs, max_new_tokens=40)
```

```
print(tokenizer.decode(outputs[0][inputs["input_ids"].shape[-1]:]))
```

Settings

vLLM

How to use HuggingFaceTB/SmolLM3-3B with vLLM:

Install from pip and serve model

```
# Install vLLM from pip:
```

```
pip install vllm
```

```
# Start the vLLM server:
```

```
vllm serve "HuggingFaceTB/SmolLM3-3B"
```

```
# Call the server using curl (OpenAI-compatible API):
curl -X POST "http://localhost:8000/v1/chat/completions" \
  -H "Content-Type: application/json" \
  --data '{
    "model": "HuggingFaceTB/SmolLM3-3B",
    "messages": [
      {
        "role": "user",
        "content": "What is the capital of France?"
      }
    ]
  }'
```

Use Docker

```
docker model run hf.co/HuggingFaceTB/SmolLM3-3B
SGLang
```

How to use HuggingFaceTB/SmolLM3-3B with SGLang:

Install from pip and serve model

# Install SGLang from pip:

```
pip install sglang
```

# Start the SGLang server:

```
python3 -m sglang.launch_server \
  --model-path "HuggingFaceTB/SmolLM3-3B" \
  --host 0.0.0.0 \
  --port 30000
```

# Call the server using curl (OpenAI-compatible API):

```
curl -X POST "http://localhost:30000/v1/chat/completions" \
  -H "Content-Type: application/json" \
  --data '{
    "model": "HuggingFaceTB/SmolLM3-3B",
    "messages": [
      {
        "role": "user",
        "content": "What is the capital of France?"
      }
    ]
  }'
```

Use Docker images

```
docker run --gpus all \
  --shm-size 32g \
  -p 30000:30000 \
  -v ~/.cache/huggingface:/root/.cache/huggingface \
  --env "HF_TOKEN=<secret>" \
  --ipc=host \
  lmsysorg/sglang:latest \
  python3 -m sglang.launch_server \
    --model-path "HuggingFaceTB/SmolLM3-3B" \
    --host 0.0.0.0 \
    --port 30000
```

# Call the server using curl (OpenAI-compatible API):

```
curl -X POST "http://localhost:30000/v1/chat/completions" \
  -H "Content-Type: application/json" \
  --data '{
    "model": "HuggingFaceTB/SmolLM3-3B",
```

```

        "messages": [
            {
                "role": "user",
                "content": "What is the capital of France?"
            }
        ]
    }'

```

Docker Model Runner

How to use HuggingFaceTB/SmolLM3-3B with Docker Model Runner:

```
docker model run hf.co/HuggingFaceTB/SmolLM3-3B
```

Browse Quantizations to use this model in llama.cpp, Ollama, LM Studio, or any compatible app.

Model Summary

SmolLM3 is a 3B parameter language model designed to push the boundaries of small models. It supports dual mode reasoning, 6 languages and long context. SmolLM3 is a fully open model that offers strong performance at the 3B–4B scale.

The model is a decoder-only transformer using GQA and NoPE (with 3:1 ratio), it was pretrained on 11.2T tokens with a staged curriculum of web, code, math and reasoning data. Post-training included midtraining on 140B reasoning tokens followed by supervised fine-tuning and alignment via Anchored Preference Optimization (APO).

Key features

Instruct model optimized for hybrid reasoning

Fully open model: open weights + full training details including public data mixture and training configs

Long context: Trained on 64k context and supports up to 128k tokens using YARN extrapolation

Multilingual: 6 natively supported (English, French, Spanish, German, Italian, and Portuguese)

For more details refer to our blog post: <https://hf.co/blog/smollm3>

How to use

The modeling code for SmolLM3 is available in transformers v4.53.0, so make sure to upgrade your transformers version. You can also load the model with the latest vllm which uses transformers as a backend.

```
pip install -U transformers
```

```
from transformers import AutoModelForCausalLM, AutoTokenizer
```

```
model_name = "HuggingFaceTB/SmolLM3-3B"
```

```

device = "cuda" # for GPU usage or "cpu" for CPU usage

# load the tokenizer and the model
tokenizer = AutoTokenizer.from_pretrained(model_name)
model = AutoModelForCausalLM.from_pretrained(
    model_name,
).to(device)

# prepare the model input
prompt = "Give me a brief explanation of gravity in simple terms."
messages_think = [
    {"role": "user", "content": prompt}
]

text = tokenizer.apply_chat_template(
    messages_think,
    tokenize=False,
    add_generation_prompt=True,
)
model_inputs = tokenizer([text], return_tensors="pt").to(model.device)

# Generate the output
generated_ids = model.generate(**model_inputs, max_new_tokens=32768)

# Get and decode the output
output_ids = generated_ids[0][len(model_inputs.input_ids[0]) :]
print(tokenizer.decode(output_ids, skip_special_tokens=True))

```

We recommend setting temperature=0.6 and top\_p=0.95 in the sampling parameters.

#### Long context processing

The current config.json is set for context length up to 65,536 tokens. To handle longer inputs (128k or 256k), we utilize YaRN you can change the max\_position\_embeddings and rope\_scaling` to:

```

{
    ...,
    "rope_scaling": {
        "factor": 2.0, #2x65536=131 072
        "original_max_position_embeddings": 65536,
        "type": "yarn"
    }
}

```

#### Enabling and Disabling Extended Thinking Mode

We enable extended thinking by default, so the example above generates the output with a reasoning trace. For choosing between enabling, you can provide the /think and /no\_think flags through the system prompt as shown in the snippet below for extended thinking disabled. The code for generating the response with extended thinking would be the same except that the system prompt should have /think instead of /no\_think.

```

prompt = "Give me a brief explanation of gravity in simple terms."
messages = [

```

```

    {"role": "system", "content": "/no_think"},
    {"role": "user", "content": prompt}
]

text = tokenizer.apply_chat_template(
    messages,
    tokenize=False,
    add_generation_prompt=True,
)

```

We also provide the option of specifying the whether to use extended thinking through the `enable_thinking` kwarg as in the example below. You do not need to set the `/no_think` or `/think` flags through the system prompt if using the kwarg, but keep in mind that the flag in the system prompt overwrites the setting in the kwarg.

```

prompt = "Give me a brief explanation of gravity in simple terms."
messages = [
    {"role": "user", "content": prompt}
]

text = tokenizer.apply_chat_template(
    messages,
    tokenize=False,
    add_generation_prompt=True,
    enable_thinking=False
)

```

## Agentic Usage

SmolLM3 supports tool calling! Just pass your list of tools:

Under the argument `xml_tools` for standard tool-calling: these tools will be called as JSON blobs within XML tags, like `<tool_call>{"name": "get_weather", "arguments": {"city": "Copenhagen"}}</tool_call>`

Or under `python_tools`: then the model will call tools like python functions in a `<code>` snippet, like `<code>get_weather(city="Copenhagen")</code>`

from transformers import AutoModelForCausalLM, AutoTokenizer

```
checkpoint = "HuggingFaceTB/SmolLM3-3B"
```

```
tokenizer = AutoTokenizer.from_pretrained(checkpoint)
model = AutoModelForCausalLM.from_pretrained(checkpoint)
```

```

tools = [
    {
        "name": "get_weather",
        "description": "Get the weather in a city",
        "parameters": {"type": "object", "properties": {"city": {"type": "string",
"description": "The city to get the weather for"}}}}
]

```

```

messages = [
    {
        "role": "user",
        "content": "Hello! How is the weather today in Copenhagen?"
    }
]

```

```

    }
]

inputs = tokenizer.apply_chat_template(
    messages,
    enable_thinking=False, # True works as well, your choice!
    xml_tools=tools,
    add_generation_prompt=True,
    tokenize=True,
    return_tensors="pt"
)

outputs = model.generate(inputs)
print(tokenizer.decode(outputs[0]))

```

Using Custom System Instructions.

You can specify custom instruction through the system prompt while controlling whether to use extended thinking. For example, the snippet below shows how to make the model speak like a pirate while enabling extended thinking.

```

prompt = "Give me a brief explanation of gravity in simple terms."
messages = [
    {"role": "system", "content": "Speak like a pirate./think"},
    {"role": "user", "content": prompt}
]

text = tokenizer.apply_chat_template(
    messages,
    tokenize=False,
    add_generation_prompt=True,
)

```

For local inference, you can use llama.cpp, ONNX, MLX, MLC and ExecuTorch. You can find quantized checkpoints in this collection (<https://huggingface.co/collections/HuggingFaceTB/SmolLM3-686d33c1fdffe8e635317e23>)

vLLM and SGLang

You can use vLLM and SGLang to deploy the model in an API compatible with OpenAI format.

SGLang

```
python -m sglang.launch_server --model-path HuggingFaceTB/SmolLM3-3B
```

vLLM

```
vllm serve HuggingFaceTB/SmolLM3-3B --enable-auto-tool-choice --tool-call-parser=hermes
```

Setting chat\_template\_kwargs

You can specify chat\_template\_kwargs such as enable\_thinking to a deployed model by passing the chat\_template\_kwargs parameter in the API request.

```
curl http://localhost:8000/v1/chat/completions -H "Content-Type: application/json" -d '{
  "model": "HuggingFaceTB/SmolLM3-3B",
  "messages": [

```

```

    {"role": "user", "content": "Give me a brief explanation of gravity in simple terms."}
  ],
  "temperature": 0.6,
  "top_p": 0.95,
  "max_tokens": 16384,
  "chat_template_kwargs": {"enable_thinking": false}
}'

```

## Evaluation

In this section, we report the evaluation results of SmolLM3 model. All evaluations are zero-shot unless stated otherwise, and we use lighteval to run them.

We highlight the best score in bold and underline the second-best score.

### Instruction Model

#### No Extended Thinking

Evaluation results of non reasoning models and reasoning models in no thinking mode. We highlight the best and second-best scores in bold.

| Category                     | Metric | SmoLLM3-3B       |  | Qwen2.5-3B |       | Llama3.1-3B |      | Qwen3-1.7B |  |

The model has also been trained on Arabic (standard), Chinese and Russian data, but has seen fewer tokens in these languages compared to the 6 above. We report the performance on these languages for information.

| Category      | Metric | SmolLM3 | 3B Base | Qwen2.5-3B | Llama3.2 3B | Qwen3 1.7B Base |
|---------------|--------|---------|---------|------------|-------------|-----------------|
| Qwen3 4B Base |        |         |         |            |             |                 |

## Training

### Model

Architecture: Transformer decoder

Pretraining tokens: 11T

Precision: bfloat16

Software & hardware

GPUs: 384 H100

Training Framework: nanotron

Data processing framework: datatrove

Evaluation framework: lighteval

Post-training Framework: TRL

Open resources

Here is an infographic with all the training details

The datasets used for pretraining can be found in this collection and those used in mid-training and post-training will be uploaded later

The training and evaluation configs and code can be found in the [huggingface/smollm](#) repository.

The training intermediate checkpoints (including the mid-training and SFT checkpoints) are available at [HuggingFaceTB/SmolLM3-3B-checkpoints](#)

## EU Summary of Public Content

The EU AI Act requires all GPAI models to provide a Public Summary of Training Content according to a given template. You can find the summary for this model below, as well as in its development Space.

## Limitations

SmolLM3 can produce text on a variety of topics, but the generated content may not always be factually accurate, logically consistent, or free from biases present in the training data. These models should be used as assistive tools rather than definitive sources of information. Users should always verify important information and critically evaluate any generated content.
